

FLOWER SPECTRUM · A FIELD PRIMER

The nose knows.

This is just the science catching up to what people have always known.

For years, shopping for flower has meant chasing one number: **THC**. But THC only tells you how strong something is — never how it will smell, taste, or make you feel. Two flowers at the same THC can be completely different experiences.

What actually shapes that experience are **terpenes** — the aromatic compounds that give every flower its smell. They're the difference between a jar that reads as bright lemon and one that reads as heavy diesel. Your nose has always picked up on them. The Flower Spectrum just gives them names and colors.

HOW TO READ IT

Every flower is sorted into one of ten aroma profiles, each with its own color. A label's colored band tells you the profile at a glance — a solid band means one aroma dominates; a split band means it's a blend of two or three. The bigger the color, the more it leads.

THE TEN AROMA PROFILES

- | | | | |
|--|--|---|--|
|  Gas / Fuel |  Earthy / Dank |  Citrus / Bright |  Fruity / Sweet |
|  Floral / Soft |  Dessert / Creamy |  Spicy / Warm |  Piney / Fresh |
|  Herbal / Woody |  Tropical / Tangy | | |

Find a smell you're drawn to, and you'll find flower you enjoy — far more reliably than chasing a percentage. Ask any budtender to walk you across the spectrum. **Trust your nose. It's smarter than the number.**
